How To Use Data Abstraction Best Practices Privilege Scripts

An Open Source Asset for use with TIBCO® Data Virtualization

Project Name	AS Assets Data Abstraction Best Practices
Document Location	This document is only valid on the day it was printed. The source of the document will be found in the ASAssets_DataAbstractionBestPractices folder (https://github.com/TIBCOSoftware)
Purpose	Self-paced instructional

Revision History

Version	Date	Author	Comments
8.1.8	05/24/2017	Mike Tinius	Updated for Best Practices v8.1.8 – added Privilege scripts.
8.1.9	12/06/2017	Mike Tinius	Transitioned to Tibco 8.1.9
2018Q1	03/20/2018	Mike Tinius	Release 2018Q1 – no changes.
2019Q1	01/25/2019	Mike Tinius	Release 2019Q1 - no changes.
2019Q200	06/13/2019	Mike Tinius	Release 2019Q200 – no changes.
2019.300	08/01/2019	Mike Tinius	Release 2019Q300 – no changes.
2020.200	03/12/2020	Mike Tinius	Release 2020Q200 – no changes.
2020.400	12/12/2020	Mike Tinius	Updated "Learn" documentation. Fixes in View Generation and Privilege Scripts modules. Modified to add Deployment_M column to the spreadsheet tab Group_List and remove UserName_lowercase from User_List tab. Updated database maintenance tables for privileges.

Table of Contents

1   Introduction

Purpose

The purpose of Best Practices Privilege Scripts is to provide a framework for performing mass-updates on privileges based on rows maintained in a spreadsheet or a database.

The Privilege Scripts help the developer to maintain and execute privileges during deployment for the various layers. The three main areas for setting privileges are as follows:

/services/databases

/services/webservices

/shared

The strategy for setting privileges fits in generically with any folder structure within the Data Virtualization (DV) server but aligns nicely with the Data Abstraction Best Practices which uses the concept of an "organization" project folder in the three areas above. For example, it might look like this:

/services/databases/My_Organization

/services/webservices/My_Organization

/shared/My_Organization
Figure one: Technical Data Abstraction Layers

Audience

This document is intended to provide guidance for the following users:

- Data Virtualization Administrators – provides a guide for installation.

- Architects – provides the data abstraction architecture.

- Data professionals – provides background on the published views and usage.

- Operations users – provides insight into triggers and procedures that are executed.

- Project Managers – provides general information on data abstraction best practices.

References

Product references are shown below. Any references to CIS or DV refer to the current TIBCO® Data Virtualization.

- TIBCO® Data Virtualization was formerly known as

  - Cisco Data Virtualization (DV)

  - Composite Information Server (CIS)

DV Folder Structure

1) DV Folder Structure – establish the baseline concept with "Organization1" as an example.

   a. Databases – Publish views/procedures to a virtual database contained under: /services/databases/Organization1

   b. Web Services – Publish views/procedures to a virtual web service contained under: /services/webservices/Organization1

   c. Shared – Developers for Servicing create resources under: /shared/Organization1

   d. Organization – /shared/Organization1

   ▼ 📁 Organization1

      i. Business Line – /shared/Organization1/BusinessLine1

      ▼ 📁 Organization1
         ► 📁 BusinessLine1
           📁 BusinessLine2

         1. Business Areas – /shared/Organization1/BusinessLine1\BusinessArea1
a. Subject Areas –
shared/Organization1/BusinessLine1\BusinessArea1\SubjectArea1
i. Data Abstraction Folder Best Practices
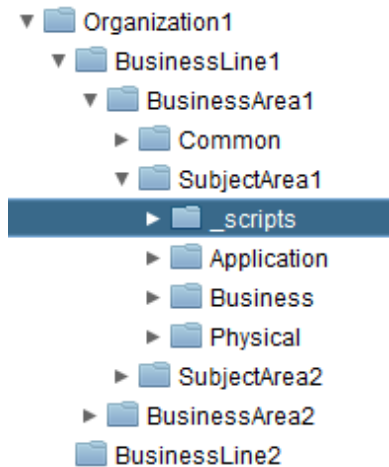

e. Data Abstraction Best Practices Folders are contained under each subject area folder.

    i. /Application

    ii. /Business

    iii. /Physical

2) Privileges on Folders – LDAP groups are created down to the granularity of the subject areas.

    a. /BusinessLine1/BusinessArea1

        i. /Common

        ii. /SubjectArea1 – subject area 1 folder

        iii. /SubjectArea2 – subject area 2 folder

3) Roles and Rules – very much pattern based in terms of the conventions for creating LDAP names

    a. Admin - **DV_<BusLine>_Admin**

        i. Administrator for Servicing folders

    b. Architect - **DV_<BusLine>_<BusArea>_Arch**

        i. Architects are responsible for their own business area /Common and /Servicing/Common. They can promote resources to a /Common folder.

        ii. Architects have "G"rant capability.

        iii. Architects are responsible for published resources to virtual databases and web services.

    c. Developer - **DV_<BusLine>_<BusArea>_Dev**

        i. Developers are responsible for developing resources in their business area folders. They can create cache objects and execute.

    d. QA - **DV_<BusLine>_<BusArea>_QA**

        i. QA technicians are responsible for executing tests and can use Studio in the QA environment. They are not allowed to modify resources.

    e. Application Id - **DV_<BusLine>_<BusArea>_UserRO_AppId**

        i. This is a read-only user for applications such as Cognos to connect to Composite.

        ii. This user does not have Studio rights.

    f. Read-only user - **DV_<BusLine>_<BusArea>_<SubjArea>_UserRO**

        i. This is a read-only user for adhoc usage such as Toad users to connect to Composite.

  ii. This user does not have Studio rights.

 g. Read-Write user - **DV_<BusLine>_<BusArea>_<SubjArea>_UserRW**

  i. This is a read-write user for adhoc usage such as Toad users to connect to Composite.

  ii. This user does not have Studio rights.

Pre-Requisites

Follow the steps below to create a new project.

1. LDAP groups have been brought into the target environment.
2. /shared/ASAssets/Utilities have been installed and configured for 2018Q1.

2   Configuration

How to Configure

This section provides information on how to configure the Privilege Scripts.

Privilege Script Configuration Summary

1. Copy privilege spreadsheet to file system

2. Modify datasource connections

3. Create privilege database tables

4. Reintrospect datasources

5. Test datasources

Best Practices Installation

1. Install Best Practices Spreadsheets

   1.1. Follow the Data Abstraction Best Practices installation directions found in this document:
   "**How To Use AS Data Abstraction Best Practices.pdf**"

2. Copy privilege spreadsheet to file system

   2.1. This should have been done during installation of the Best Practices. Verify this.

3. Modify the default settings:

   3.1. Location: /shared/ASAssets/BestPractices_v81/_ProjectMaintenance/defaultValues

   3.2. datasource: determine whether to use EXCEL or DB_[LLE,PROD] (database) as the default source for the privilege rows. Value: EXCEL

   3.3. defaultDatabaseLLEMapping: provides a way to choose Oracle or SQL Server as the default LLE when using "DB_LLE" datasource. Value: DB_LLE_ORA

   3.4. defaultDatabasePRODMapping: provides a way to choose Oracle or SQL Server as the default LLE when using "DB_PROD" datasource. Value: DB_PROD_ORA

4. Modify the data source path or connection information:

   4.1. EXCEL: modify the root path if needed.

      4.1.1.DV Location: [EXCEL]
      /shared/ASAssets/BestPractices_v81/PrivilegeScripts/Metadata/Privileges_DS_EXCEL

      4.1.2.E.g. root path: C:/CIS7.0/BestPractices/Privileges

   4.2. DATABASE: modify connection information if needed for the lower-level environment

4.2.1. Note: This capability allows for a database in LLE for development and testing of privileges and a production database. In reality, a project really only needs a production database.   All privileges are considered "production" no matter what DV environment they are being applied to. Therefore, while the scripts for LLE are provided it is not necessary to maintain an LLE privilege database.

4.2.2. Enable either Oracle or SQL Server LLE and/or PROD as needed.

4.2.3. <u>Oracle database locations</u>:

/shared/ASAssets/BestPractices_v81/PrivilegeScripts/Metadata/Privileges_DB_PROD_ORA

/shared/ASAssets/BestPractices_v81/PrivilegeScripts/Metadata/Privileges_DB_LLE_ORA

4.2.4. <u>SQL Server database locations</u>:

/shared/ASAssets/BestPractices_v81/PrivilegeScripts/Metadata/Privileges_DB_PROD_SS

/shared/ASAssets/BestPractices_v81/PrivilegeScripts/Metadata/Privileges_DB_LLE_SS

5. Create the tables

5.1. Oracle: /shared/ASAssets/BestPractices_v81/PrivilegeScripts/Metadata/DDL/Oracle/

Drop Resources: pqDrop_Privs_Oracle

```
IN debug            CHAR(1),  -- Y=debug on.  N=debug off.
IN datasource       VARCHAR, -- REQUIRED FILTER: DB_[LLE,PROD], The source of the groups.
--                  Derived from
/shared/ASAssets/BestPractices_v81/_ProjectMaintenance/defaultValues.defaultDatabaseLLEMapping or
defaultDatabasePRODMapping
--                      Refer to getPrivilegeDatasourceToScriptMapping().
--                      To override default provide explicit filter type:
--                              Oracle:    DB_LLE_ORA or DB_PROD_ORA
IN schemaName       VARCHAR,           -- Oracle schema name
OUT status          VARCHAR
```

Create Resources: pqCreate_Privs_Oracle

```
IN debug            CHAR(1),  -- Y=debug on.  N=debug off.
IN datasource       VARCHAR, -- REQUIRED FILTER: DB_[LLE,PROD], The source of the groups.
--                  Derived from
/shared/ASAssets/BestPractices_v81/_ProjectMaintenance/defaultValues.defaultDatabaseLLEMapping or
defaultDatabasePRODMapping
--                      Refer to getPrivilegeDatasourceToScriptMapping().
--                      To override default provide explicit filter type:
--                              Oracle:    DB_LLE_ORA or DB_PROD_ORA
IN schemaName       VARCHAR,           -- Oracle schema name
IN tablespaceName   VARCHAR,           -- Oracle tablespace name
OUT status          VARCHAR
```

5.2. SQL Server: /shared/ASAssets/BestPractices_v81/PrivilegeScripts/Metadata/DDL/SqlServer/

pqDrop_Privs_SqlServer

```
IN debug            CHAR(1),  -- Y=debug on.  N=debug off.
IN datasource       VARCHAR, -- REQUIRED FILTER: DB_[LLE,PROD], The source of the groups.
--                  Derived from
/shared/ASAssets/BestPractices_v81/_ProjectMaintenance/defaultValues.defaultDatabaseLLEMapping or
defaultDatabasePRODMapping
```

```
--              Refer to getPrivilegeDatasourceToScriptMapping().
--              To override default provide explicit filter type:
--                          Sql Server: DB_LLE_SS or DB_PROD_SS
IN schemaName   VARCHAR,        -- Sql Server schema name
OUT status      VARCHAR
```

pqCreate_Privs_SqlServer

```
IN debug        CHAR(1),   -- Y=debug on.  N=debug off.
IN datasource   VARCHAR, -- REQUIRED FILTER: DB_[LLE,PROD], The source of the groups.
--              Derived from
/shared/ASAssets/BestPractices_v81/_ProjectMaintenance/defaultValues.defaultDatabaseLLEMapping or
defaultDatabasePRODMapping
--              Refer to getPrivilegeDatasourceToScriptMapping().
--              To override default provide explicit filter type:
--                          Sql Server: DB_LLE_SS or DB_PROD_SS
IN schemaName   VARCHAR,        -- Sql Server schema name
IN filegroupName VARCHAR,       -- Sql Server file group name
OUT status      VARCHAR
```

6. Reintrospect the data sources

7. Add/Remove tables starting with PRIV_

8. Test the data sources

   8.1. Show Contents for one of the Excel data source worksheets to ensure that data is being retrieved.

   8.2. Show Contents for one of the tables in the chosen data source.

9. Construct the Privilege Spreadsheet to be loaded into the database

10. Load the database from the spreadsheet

   10.1.   loadPrivileges_EXCEL - the first time, it will notify you of the missing support table values. This will load the privileges from the 3 privilege tabs in the spreadsheet.

   10.2.   loadGroups_EXCEL - optional unless you want to set the Studio Rights for the DV groups in the Group_List tab of the spreadsheet.

   10.3.   loadUsers_EXCEL – optional

11. Execute the update Groups, Privileges, and Users as needed.

   Go to the next section "Executing Resource Privileges" for more information.

3   Executing Resource Privileges

Introduction

This section provides guidance on how to make a request to the administrator to update the privileges using the manual execution of privileges.

Instructions

1. Run after hours or early in the morning so as not to impact Developers. Since these scripts are updating the Composite Metadata repository via the API, Developers will notice that their Studios will be unresponsive while these scripts are running.

2. Depending on activity in the network, activity on the Composite server and activity in the Composite repository database server, these scripts may take hours to run.
   2.1. Update Groups does not take much time at all. This is a very low impact operation.
   2.2. Update Resource Privileges will take the longest especially depending on the number of privileges to apply.

3. **Update Group Studio Rights before updating privileges**
   3.1. Sheet [When Datasource=EXCEL]: Group_List
   3.2. Table [When Datasource=DB_PROD or DB_LLE]: COMPOSITE_STUDIO_RIGHTS

   3.3. Script: **updateGroupsDriver**
      3.3.1. **Location: /shared/ASAssets/BestPractices_v81/PrivilegeScripts/updateGroupsDriver**
      3.3.2. Datasource: [DB_PROD|DB_LLE|EXCEL] – Indicates which datasource to use to execute from.
      3.3.3. *Environment_Name*:   [DEV|**UAT**|PROD**]**
      3.3.4. *Organization:*   ORG1
      3.3.5. ***Project***:   **Project1**
      3.3.6. ***Subproject***   ***SB1***
      3.3.7. All other parameters are left null
      3.3.8. *inDebug1*:   Y
      3.3.9. *inDebug1Console*:   Y
      3.3.10.   *inDebug1CISLog*:   N
      3.3.11.   *inDebug1ReadOnly*:   Y
      3.3.12.   **Repeat for these projects**:
            Project:
            Project2

4. **Update Privileges**

4.1. Sheet [When Datasource=EXCEL]: Privileges_shared + Privileges_databases + Privileges_webservices

4.2. Table [When Datasource=DB_PROD or DB_LLE]: PRIV_PRIVILEGES

4.3. Script: **updatePrivilegesDriver**

    4.3.1. **Location: /shared/ASAssets/BestPractices_v81/PrivilegeScripts/updatePrivilegesDriver**

    4.3.2. Datasource: [DB_PROD|DB_LLE|EXCEL] – Indicates which datasource to use to execute from.

    4.3.3.

    4.3.4. *Batch_Privileges*:   1

    4.3.5. *Environment_Name*:   [DEV|**UAT**|PROD**]**

    4.3.6. *Organization:*   ORG1

    4.3.7. *Project*:   **Project1**

    4.3.8. *Subproject:*   SB1

    4.3.9. All other parameters are left null

    4.3.10.   *inDebug1*:   Y

    4.3.11.   *inDebug1Console*:   Y

    4.3.12.   *inDebug1CISLog*:   N

    4.3.13.   *inDebug1ReadOnly*: Y

    4.3.14.   *inDebug1RevokeAll*: Y

    4.3.15.   *inDebug2*:   N

    4.3.16.   *inBypassErrors:*   Y

    4.3.17.   **Repeat for these projects**:

Project:	Subproject:
Project2	SB1|SB2|SB3

4 Privilege Spreadsheet and Database Table Mappings

Spreadsheet "sheet definition" and Associated Database Table

1) Composition of the spreadsheet / database table

    a. Privileges_shared – This sheet is used to establish privileges for a project and its /shared resources.

        i. Correlates to the database table PRIV_PRIVILEGES where PRIVILEGE_TYPE = 'SHARED'.

    b. Privileges_databases – This sheet is used to establish privileges for a project and its virtual database resource located at /services/databases.

        i. Correlates to the database table PRIV_PRIVILEGES where PRIVILEGE_TYPE = 'DATABASES'.

    c. Privileges_webservices – This sheet is used to establish privileges for a project and its virtual web service resources located at /services/webservices.

        i. Correlates to the database table PRIV_PRIVILEGES where PRIVILEGE_TYPE = 'WEBSERVICES'.

    d. Group_List – The group list sheet is used for applying studio access rights to a group.

        i. Correlates to the database table PRIV_GOUPS.

    e. User_List – The user list sheet is used for creating composite users that "mirror" the ldap groups for testing purposes.

        i. Correlates to the database table PRIV_USERS.

    f. Roles_and_Responsibilities – not used for any scripts (documentation only)

        i. No database table correlation.

    g. Privilege_Template – not used for any scripts (documentation only)

        i. No database table correlation.

2) Spreadsheet Concepts

    a. Applying privileges

i. Apply privileges to lowest level folders first. For example, given /shared/folder1 and /shared/folder1/folder2, apply privileges to /shared/folder1 before /folder2.

ii. READ only privileges – The update privileges have the ability to automatically set READ on parent folders. The benefit of this is that these rows do not have to be specified in the spreadsheet any longer like they did with version 1.

iii. Apply a concept of initializing folders to "NONE" recursively first to create a blank pallet on which to paint privileges.

iv. If a folder shares privileges with another sibling folder then don't apply privileges recursively. Simply set privileges on that folder for your groups. Example:

   1. /shared/folder1 (your folder)

      a. Set recursive mode="N" for "not" recursive.

   2. /shared/folder2 (another groups folder)

v. Spreadsheet column: Recurse Child

Recurse Child Resources and Folders:
N or blank = do not recurse. Set specified privileges for the resource only.
YM = Only apply modification recursively (always recommended when using the spreadsheet)
YC = Make child resources look like this resource recursively. This feature is **not recommended** when using the spreadsheet and making multiple modifications because the entire context is not taken into consideration like it does in studio.

Concept 1: Only select YM to recurse child resources when the resource being set is at the lowest level at which it is safe to recursively set privileges for a given USER or GROUP. If the resource is an intermediate level folder with other branches offshoot from it then only apply the privilege modification to the resource folder using "N" unless all branches are required to have the same privilege settings. "YC" should only be used when you want to reset all privileges for other USERS or GROUPS to "NONE" except for the current USER or GROUP being set.

Concept 2: If the higher-level resource folder is set with "YC" then it is not necessary to set this USER or GROUP for branch-level resources.

Caveat: It has been determined through testing because the Composite API is being used to set privileges, only "YM" should be used since each transaction on the spreadsheet is executed individually.   This differs from the concept in Studio, where Studio has a holistic view of all privileges for all groups for a given resource. Therefore, in Studio, you can set the equivalent of "YC" which is recurse all children and make them look exactly like the parent. Unfortunately, that concept is not the same when executed from this spreadsheet and API.

b. Batching privileges

   i. Privileges are batched and executed as a single unit request to DV. The batches are based on finding a set of rows in the spreadsheet with the same path, type and recurse child settings. If any of those change, then that delineates the batch request to DV.

c. Spreadsheet Line

   i. Each spreadsheet line (like a database row) needs to include all of the information to be able to set a row independently if requested. However, if batching privileges is requested then the first row of a batch is used to set the resource path, type, recurse child.

   ii. If the resource path or type are missing, that line in the spreadsheet will *NOT* be applied.

   iii. It is important to note that the first row of a batch is used exclusively to set the owner and owner domain since this can only be set at the resource path level. By definition of a batch [resource path, type, recurse child] will start a new batch.

5   Privilege Scripts Method Definition

Detailed Definitions

Detailed documentation on the inputs and outputs can be found in the header and annotation section of each procedure.

1)   Composite groups and users – If you are adding groups and users, you must first execute the "updateGroupsDriver" followed by the "udpateUsersDriver".   Groups must be present before users are created because users are assigned to groups upon creation of the user.

2)   Validation – you can validate the groups and users were created by using "validateGroupsDriver", "validateUsersDriver" and "validatePrivilegesDriver".

3)   Delete groups and users – If you want to clean up the composite created users and groups perform these tasks in reverse order of creation.   First execute "deleteUsersDriver" to remove the users followed by "deleteGroupsDriver" to remove the groups.

Privilege Maintenance: Get Privileges

1. **getPrivileges –** Construct a SQL statement based on filters passed in and retrieve the set of privileges that match the criteria.

    Location: /shared/ASAssets/BestPractices_v81/PrivilegeScripts/getPrivileges

Direction	Parameter Name	Parameter Type
IN	**Datasource** – RECOMMENDED FILTER: the datasource where the privileges are stored. If not parameter is provided the default value is used from defaultValues.datasource. Possible values include: • EXCEL - Excel spreadsheet which gets uploaded to each DV server. • DB_LLE - SQL Server database for lower level environments. Basically it is used for testing purposes and developing new functionality. • DB_PROD - SQL Server production database. This connection should always be used unless developing new functionality.	VARCHAR(255)
IN	**Environment_Name** – REQUIRED FILTER: The Composite server environment in which to get/update privileges for: [DEV, UAT, PROD].	VARCHAR(255)
IN	**Organization** – RECOMMENDED FILTER: The name of the organization such as ORG1 or ORG2.	VARCHAR(255)

Direction	Parameter Name	Parameter Type
IN	**Project** – RECOMMENDED FILTER: The name of the project that is hosted on DV for this "Env Type". This provides a filter for only applying privileges for the given project. If left blank, all projects will be updated.	VARCHAR(255)
IN	**SubProject** – OPTIONAL FILTER*:* The name of the sub-project that is hosted on DV for this "Env Type". This provides a filter for only applying privileges for the given sub-project. If left blank, all rows for the project will be updated.	VARCHAR(255)
IN	**Sheet_Name** – OPTIONAL FILTER: The name of the Excel spreadsheet in which to get/update privileges from: [shared, databases, webservices]	VARCHAR(255)
IN	**Resource_Path** – OPTIONAL FILTER: The resource path in which to get/update privileges.	LONGVARCHAR
IN	**Resource_Type** – OPTIONAL FILTER: The resource type in which to get/update privileges. This will only be used when no "Resource_Path" or a single "Resource_Path" is provided. It is not used when a list of "Resource_Path" entries are provided. Example: • DATA_SOURCE - a published datasource or physical metadata datasource. • CONTAINER - a folder path, a catalog or schema path. • COLUMN - a column from a table • LINK - a published table or procedure. If it resides in the path /services and points to a TABLE or PROCEDURE then it is a LINK. • TABLE - a view in the /shared path. • PROCEDURE a procedure in the /shared path.	LONGVARCHAR
IN	**Name** – OPTIONAL FILTER: The user/group name in which to get/update privileges.	VARCHAR(255)
IN	**Name_Type** – OPTIONAL FILTER: Valid values are USER or GROUP.	VARCHAR(255)
IN	**Domain_Name** – OPTIONAL FILTER: The domain name in which to get/update privileges.	VARCHAR(255)
IN	**debug** – OPTIONAL: Y=debug on, N=debug off	CHAR(1)
OUT	DECLARE PUBLIC TYPE privilegeRowType ROW (　　rownum INTEGER, 　　sheetRownum INTEGER, 　　datasource VARCHAR(255), 　　sheetName VARCHAR(255), 　　privilegeType VARCHAR(255), 　　Organization VARCHAR(255), 　　Project VARCHAR(255), 　　SubProject VARCHAR(255), 　　"Resource Path" VARCHAR(1024),	privilegeRowType

Direction	Parameter Name	Parameter Type
	"Resource Type" VARCHAR(255), "Recurse Dependencies" VARCHAR(1), "Recurse Dependents" VARCHAR(1), "Recurse Child" VARCHAR(3), "Revoke All" VARCHAR(1), Name VARCHAR(255), "Name Type" VARCHAR(255), "Domain" VARCHAR(255), "Env Type" VARCHAR(255), OrderPrecedence CHAR(1), R VARCHAR(1), W VARCHAR(1), E VARCHAR(1), S VARCHAR(1), U VARCHAR(1), I VARCHAR(1), D VARCHAR(1), G VARCHAR(1), Owner VARCHAR(255), "Owner Domain" VARCHAR(255), Comments VARCHAR(1024), Initialize VARCHAR(255), isActive CHAR(1))	

Privilege Maintenance: Update Privileges

2. **updatePrivilegesDriver –** This script is used to execute the update privileges. This script will access the spreadsheet or database table, batch rows together into a request and submit to DV via the DV admin API.   The script runs within the Composite Server. This procedure is used to update privileges by reading the privileges from an excel spreadsheet or database table.

   Location: /shared/ASAssets/BestPractices_v81/PrivilegeScripts/updatePrivilegesDriver

   2.1. The excel sheets include:

   2.1.1.   Privileges_shared - Update privileges for /shared

   2.1.2.   Privileges_databases - Update privileges for /services/databases

   2.1.3.   Privileges_webservices - Update privileges for /services/webservices

   2.1.4.   PRIV_PRIVILEGES is a table that contains a type field that indicates which area of composite the row is specifying [shared, databases, webservices].

   2.2. Pre-requisites to executing the script.

2.2.1. LDAP groups must have been brought into Composite.

2.2.2. The spreadsheet needs to be uploaded to the Composite Server machine.

2.2.3. The spreadsheet data source is updated with the spreadsheet path.

2.2.4. All of the resources being referenced must be present in the Composite server or an exception will be thrown.

2.2.5. The user executing the script must have administrative privileges.

Direction	Parameter Name	Parameter Type
IN	**Datasource** – RECOMMENDED FILTER: the datasource where the privileges are stored. If not parameter is provided the default value is used from defaultValues.datasource. Possible values include: • EXCEL - Excel spreadsheet which gets uploaded to each DV server. • DB_LLE - SQL Server database for lower level environments. Basically it is used for testing purposes and developing new functionality. • DB_PROD - SQL Server production database. This connection should always be used unless developing new functionality.	VARCHAR(255)
IN	**Batch_Privileges** – REQUIRED_FILTER: When the resource path in the spreadsheet changes, a batch is executed. When the resource type in the spreadsheet changes, a batch is executed. When the recursion identifier in the spreadsheet changes, a batch is executed. A group of rows with like recursion may only be batched together otherwise the meaning of the privilege setting is not the same. • 1=Batch all privileges for the same path, type and recursion setting. • 0=Process each spreadsheet line separately (no batching).	INTEGER
IN	**Environment_Name** – REQUIRED FILTER: The Composite server environment in which to get/update privileges for: [DEV, UAT, PROD].	VARCHAR(255)
IN	**Organization** – RECOMMENDED FILTER: The name of the organization such as ORG1 or ORG2.	VARCHAR(255)
IN	**Project** – RECOMMENDED FILTER: The name of the project that is hosted on DV for this "Env Type". This provides a filter for only applying privileges for the given project. If left blank, all projects will be updated.	VARCHAR(255)

Direction	Parameter Name	Parameter Type
IN	**SubProject** – OPTIONAL FILTER*:* The name of the sub-project that is hosted on DV for this "Env Type". This provides a filter for only applying privileges for the given sub-project. If left blank, all rows for the project will be updated.	VARCHAR(255)
IN	**Sheet_Name** – OPTIONAL FILTER: The name of the Excel spreadsheet in which to get/update privileges from: [shared, databases, webservices]	VARCHAR(255)
IN	**Resource_Path** – OPTIONAL FILTER: The resource path in which to get/update privileges.	LONGVARCHAR
IN	**Resource_Type** – OPTIONAL FILTER: The resource type in which to get/update privileges. This will only be used when no "Resource_Path" or a single "Resource_Path" is provided. It is not used when a list of "Resource_Path" entries are provided. Example: • DATA_SOURCE - a published datasource or physical metadata datasource. • CONTAINER - a folder path, a catalog or schema path. • COLUMN - a column from a table • LINK - a published table or procedure. If it resides in the path /services and points to a TABLE or PROCEDURE then it is a LINK. • TABLE - a view in the /shared path. • PROCEDURE a procedure in the /shared path.	LONGVARCHAR
IN	**Name** – OPTIONAL FILTER: The user/group name in which to get/update privileges.	VARCHAR(255)
IN	**Name_Type** – OPTIONAL FILTER: Valid values are USER or GROUP.	VARCHAR(255)
IN	**Domain_Name** – OPTIONAL FILTER: The domain name in which to get/update privileges.	VARCHAR(255)
IN	**preview** – N or null(default)=Do not preview. Execute the privileges. Y=preview what will get set but don't actually execute the operation.	CHAR(1)
IN	**forceDomainAsComposite** – OPTIONAL PARAM: Y=true, N=false. For example, the LDAP group DV_Demo_Dev is automatically converted to the composite domain group dv_demo_dev. • Provides a way to force a conversion of the group from an LDAP domain name like "ldap" to the "composite" domain. • This is useful when setting up the privileges for testing with composite groups that mirror the LDAP groups. This way the spreadsheet does not have to be modified.	CHAR(1)

OUT	**rowsProcessed** – number of rows processed from the spreadsheet	INTEGER

Direction	Parameter Name	Parameter Type
OUT	**logOutput** – The output log that gets printed to the command line console is also output.	LONGVARCHAR

User Maintenance: Validate Users

11. **validateUsersDrivers –** This script is used to validate users. Reads the Composite Privileges spreadsheet and validates whether the group exists or not using the sheet: User_List.

Location: /shared/ASAssets/BestPractices_v81/PrivilegeScripts/validateUsersDriver

Direction	Parameter Name	Parameter Type
IN	**Datasource** – RECOMMENDED FILTER: the datasource where the privileges are stored. If not parameter is provided the default value is used from defaultValues.datasource. Possible values include: • EXCEL – Excel spreadsheet which gets uploaded to each DV server. • DB_LLE – SQL Server database for lower level environments. Basically, it is used for testing purposes and developing new functionality. • DB_PROD – SQL Server production database. This connection should always be used unless developing new functionality.	VARCHAR(255)
IN	**Environment_Name** – REQUIRED FILTER: The Composite server environment in which to get/update privileges for: [DEV, UAT, PROD].	VARCHAR(255)
IN	**Organization** – RECOMMENDED FILTER: The name of the organization such as ORG1 or ORG2.	VARCHAR(255)
IN	**Project** – RECOMMENDED FILTER: The name of the project that is hosted on DV for this "Env Type". This provides a filter for only applying privileges for the given project. If left blank, all projects will be updated.	VARCHAR(255)
IN	**SubProject** – OPTIONAL FILTER*:* The name of the sub-project that is hosted on DV for this "Env Type". This provides a filter for only applying privileges for the given sub-project. If left blank, all rows for the project will be updated.	VARCHAR(255)
IN	**User_Name** – OPTIONAL FILTER*:* The user name for which to validate users.	VARCHAR(255)
IN	**Domain_Name** – OPTIONAL FILTER: The domain name in which to validate users.	VARCHAR(255)

Direction	Parameter Name	Parameter Type
IN	**inDebug1** – N/Null=No debug, Y (default)=Debug for this procedure – basic messages.	CHAR(1)
IN	**inDebug1Console** – N/Null (default)=No debug, Y=Debug console. Determines whether to print to the Studio console window or not.	CHAR(1)
IN	**inDebug1CISLog** – N/Null (default)=No debug, Y=Debug log. Determines whether to print to the DV log or not.	CHAR(1)
IN	**inDebug2** – N/Null (default)=No debug, Y=Debug for 2nd and 3rd tier procedures (deep debug).	CHAR(1)
OUT	**validUsers** – true=if all users are present (valid). False=if one or more users are not present (invalid).	VARCHAR
OUT	**rowsProcessed** – number of rows processed from the spreadsheet	INTEGER
OUT	**logOutput** – The output log that gets printed to the command line console is also output.	LONGVARCHAR
OUT	**userResult** – Result with pipe delimited rows	LONGVARCHAR

Database Maintenance: Load Database Privileges

12. **loadPrivileges_EXCEL –** This procedure is the generic interface for inserting, updating, and deleting privileges from the generic Resource_Privileges_LOAD_DB.xlsx spreadsheet. The location of the resource in DV is as follows:
/shared/ASAssets/BestPractices_v81/PrivilegeScripts/Metadata/Privileges_DS_EXCEL/Resource_Privileges_LOAD_DB.xlsx.

A delete may be performed from this procedure but it must follow these rules:

1. Perform delete as per filters [Organization, Project, SubProject] from rows in that exist in the EXCEL spreadsheet.

2. This will not delete rows that are not specified in the spreadsheet.

Alternatively, use a broader delete capability: deletePrivileges_DB()

 Location:
/shared/ASAssets/BestPractices_v81/PrivilegeScripts/ModifyDBPrivileges/loadPrivileges_EXCEL

Direction	Parameter Name	Parameter Type
IN	**debug** – Y=debug on. N=debug off.	VARCHAR
IN	**datasource** – REQUIRED FILTER: DB_[LLE,PROD], The target database of the privileges. • DB_LLE – SQL Server database for lower level	VARCHAR(255)

Direction	Parameter Name	Parameter Type
	environments. Basically, it is used for testing purposes and developing new functionality. • DB_PROD – SQL Server production database. This connection should always be used unless developing new functionality. • To override the default, provide explicit filter type: • Oracle: DB_LLE_ORA or DB_PROD_ORA • Sql Server: DB_LLE_SS or DB_PROD_SS	
IN	**Organization** – [optional] Provides a filter to only load rows in the spreadsheet for this organization name.	VARCHAR
IN	**Project** – [optional] Provides a filter to only load rows in the spreadsheet for this project name.	VARCHAR
IN	**SubProject** – [optional] Provides a filter to only load rows in the spreadsheet for this subproject name.	VARCHAR
IN	**performInsertUpdate** – Y or N. Y=yes perform insert or update. N=no do not perform insert or update but display the same messages to see what will be executed.	CHAR(1)
IN	**performDelete** – Y or N. Y=perform delete as per filters [Organization, Project, SubProject] from rows in the EXCEL spreadsheet. Note: This will not delete rows that are not specified in the spreadsheet. Alternatively, use a broader delete capability: deletePrivileges_DB(). N=do not perform the delete of rows.	CHAR(1)
OUT	**datasourcePath** – The datasource path tables that were updated.	VARCHAR
OUT	**rowsProcessed** – Number of rows processed in total.	INTEGER
OUT	**rowsInserted** – Number of rows inserted into the privilege database.	INTEGER
OUT	**rowsUpdated** – Number of rows updated into the privilege database.	INTEGER
OUT	**rowsDeleted** – Number of rows deleted into the privilege database.	INTEGER
OUT	**rowsInactive** – Number of rows set to inactive into the privilege database.	INTEGER
OUT	**duplicateRows** – number of duplicate rows.	INTEGER
OUT	**duplicateRowMsg** – message for duplicate rows.	LONGVARCHAR
OUT	**maintenanceMessage** – message from the performSupportingTableMaintenance() procedure if applicable.	LONGVARCHAR

Direction	Parameter Name	Parameter Type
OUT	**maintenanceProjectPairs** – The number of Organization/Project combination pairs updated during performSupportingTableMaintenance().	INTEGER
OUT	**message** – a general message	LONGVARCHAR

Database Maintenance: Delete Database Privileges

13. **deletePrivileges_DB –** This procedure is the delete privileges in the database table PRIV_PRIVILEGES that is associated with the input variable "datasource".

Location:
/shared/ASAssets/BestPractices_v81/PrivilegeScripts/ModifyDBPrivileges/deletePrivileges_DB

Direction	Parameter Name	Parameter Type
IN	**debug** – Y=debug on. N=debug off.	VARCHAR
IN	**datasource** – REQUIRED FILTER: DB_[LLE,PROD], The target database of the privileges. • DB_LLE – SQL Server database for lower level environments. Basically, it is used for testing purposes and developing new functionality. • DB_PROD – SQL Server production database. This connection should always be used unless developing new functionality. • To override the default, provide explicit filter type: • Oracle: DB_LLE_ORA or DB_PROD_ORA • Sql Server: DB_LLE_SS or DB_PROD_SS	VARCHAR
IN	**performDelete** – Y or N. Y=perform delete as per input filters [Organization, Project, SubProject] from rows in the database table. N=do not perform the delete of rows..	CHAR(1)
IN	**Organization** – [recommended] Provides a filter to delete rows from the database table for this organization name. Wild card character=%	VARCHAR
IN	**Project** – [recommended] Provides a filter to delete rows from the database table for this project name. Wild card character=%	VARCHAR
IN	**SubProject** – [optional] Provides a filter to delete rows from the database table for this subproject name. Wild card character=%	VARCHAR
IN	**EnvironmentName** – [optional] The TDV server environment [DEV, TEST, UAT, PROD] in which to delete rows from the database table. No wild card allowed.	VARCHAR

Direction	Parameter Name	Parameter Type
IN	**ResourcePath** – [optional] The resource path in which to get/update privileges. It may contain a wildcard "%". It may be a comma-separated list of paths. IMPORTANT: If columns or paths contain commas they must be encoded with the value "_002C" prior to be passed into this procedure. This procedure will decode each path from "_002C" to "," before search for privileges.	LONGVARCHAR
IN	**ResourceType** – [optional] The resource type in which to get/update privileges. It is always upper case. This will only be used when no "Resource_Path" or a single "Resource_Path" is provided. It is not used when a list of "Resource_Path" entries are provided. Example of resource types: • DATA_SOURCE - a published datasource or physical metadata datasource. • CONTAINER - a folder path, a catalog or schema path. • COLUMN - a column from a table • LINK - a published table or procedure. If it resides in the path /services and points to a TABLE or PROCEDURE then it is a LINK. • TABLE - a view in the /shared path. • PROCEDURE - a procedure in the /shared path.	VARCHAR
IN	**Name** – [optional] The user/group name for which to delete rows from the database table.	VARCHAR
IN	**NameType** – [optional] Valid values are USER or GROUP	VARCHAR
IN	**DomainName** – [optional] The domain name in which to delete rows from the database table.	VARCHAR
OUT	**Status** – SUCCESS, NODELETE or FAIL [if FAIL then review message output]	VARCHAR
OUT	**datasourcePath** – The datasource path tables that were updated.	VARCHAR
OUT	**rowsDeleted** – Number of rows deleted into the privilege database.	INTEGER
OUT	**message** – a general message	LONGVARCHAR
OUT	**sqlStatement** – The SQL Statement issued to delete rows.	LONGVARCHAR

Database Maintenance: Load Database Groups

14. **loadGroups_EXCEL –** This procedure is the generic interface for inserting and updating groups from the generic Resource_Privileges_LOAD_DB.xlsx spreadsheet. The location of the resource in DV is as follows:

/shared/ASAssets/BestPractices_v81/PrivilegeScripts/Metadata/Privileges_DS_EXCEL/Resource_Privileges_LOAD_DB.xlsx.

A delete may be performed from this procedure but it must follow these rules:

1. Perform delete as per filters [Organization, Project, SubProject] from rows in that exist in the EXCEL spreadsheet.

2. This will not delete rows that are not specified in the spreadsheet.

Alternatively, use a broader delete capability: deleteGroups_DB()

Location:
/shared/ASAssets/BestPractices_v81/PrivilegeScripts/ModifyDBPrivileges/loadGroups_EXCEL

Direction	Parameter Name	Parameter Type
IN	**debug** – Y=debug on. N=debug off.	VARCHAR
IN	**datasource** – REQUIRED FILTER: DB_[LLE,PROD], The target database of the groups. • DB_LLE – SQL Server database for lower level environments. Basically, it is used for testing purposes and developing new functionality. • DB_PROD – SQL Server production database. This connection should always be used unless developing new functionality. • To override the default, provide explicit filter type: • Oracle: DB_LLE_ORA or DB_PROD_ORA • Sql Server: DB_LLE_SS or DB_PROD_SS	VARCHAR(255)
IN	**Organization** – [optional] Provides a filter to only load rows in the spreadsheet for this organization name.	VARCHAR
IN	**Project** – [optional] Provides a filter to only load rows in the spreadsheet for this project name.	VARCHAR
IN	**SubProject** – [optional] Provides a filter to only load rows in the spreadsheet for this subproject name.	VARCHAR
IN	**performInsertUpdate** – Y or N. Y=yes perform insert or update. N=no do not perform insert or update but display the same messages to see what will be executed.	CHAR(1)
IN	**performDelete** – Y or N. Y=perform delete as per filters [Organization, Project, SubProject] from rows in the EXCEL spreadsheet. Note: This will not delete rows that are not specified in the spreadsheet. Alternatively, use a broader delete capability: deleteGroups_DB(). N=do not perform the delete of	CHAR(1)

Direction	Parameter Name	Parameter Type
	rows.	
IN	**useDefaultConfig** – Y or N. Y=use the default config values for the following thus overriding the spreadsheet values. READ_ALL_CONFIG=null - this value unset MODIFY_ALL_CONFIG=null - this value unset READ_ALL_RESOURCES=null - this value unset MODIFY_ALL_RESOURCES=null- this value unset	CHAR(1)
OUT	**datasourcePath** – The datasource path tables that were updated.	VARCHAR
OUT	**rowsProcessed** – Number of rows processed in total.	INTEGER
OUT	**rowsInserted** – Number of rows inserted into the privilege database.	INTEGER
OUT	**rowsUpdated** – Number of rows updated into the privilege database.	INTEGER
OUT	**rowsDeleted** – Number of rows deleted into the privilege database.	INTEGER
OUT	**rowsInactive** – Number of rows set to inactive into the privilege database.	INTEGER
OUT	**duplicateRows** – number of duplicate rows.	INTEGER
OUT	**duplicateRowMsg** – message for duplicate rows.	LONGVARCHAR
OUT	**maintenanceMessage** – message from the performSupportingTableMaintenance() procedure if applicable.	LONGVARCHAR
OUT	**maintenanceProjectPairs** – The number of Organization/Project combination pairs updated during performSupportingTableMaintenance().	INTEGER
OUT	**message** – a general message	LONGVARCHAR

Database Maintenance: Delete Database Groups

15. **deleteGroups_DB –** This procedure is the delete groups in the database table PRIV_GROUPS that is associated with the input variable "datasource".

Location: /shared/ASAssets/BestPractices_v81/PrivilegeScripts/ModifyDBPrivileges/deleteGroups_DB

Direction	Parameter Name	Parameter Type
IN	**debug** – Y=debug on. N=debug off.	VARCHAR
IN	**datasource** – REQUIRED FILTER: DB_[LLE,PROD], The target database of the privileges.	VARCHAR

Direction	Parameter Name	Parameter Type
	• DB_LLE – SQL Server database for lower level environments. Basically, it is used for testing purposes and developing new functionality. • DB_PROD – SQL Server production database. This connection should always be used unless developing new functionality. • To override the default, provide explicit filter type: • Oracle: DB_LLE_ORA or DB_PROD_ORA • Sql Server: DB_LLE_SS or DB_PROD_SS	
IN	**performDelete** – Y or N. Y=perform delete as per input filters [Organization, Project, SubProject] from rows in the database table. N=do not perform the delete of rows..	CHAR(1)
IN	**Organization** – [recommended] Provides a filter to delete rows from the database table for this organization name. Wild card character=%	VARCHAR
IN	**Project** – [recommended] Provides a filter to delete rows from the database table for this project name. Wild card character=%	VARCHAR
IN	**SubProject** – [optional] Provides a filter to delete rows from the database table for this subproject name. Wild card character=%	VARCHAR
IN	**EnvironmentName** – [optional] The TDV server environment [DEV, TEST, UAT, PROD] in which to delete rows from the database table. No wild card allowed.	VARCHAR
IN	**GroupName** – [optional] The group name for which to delete rows from the database table.	VARCHAR
IN	**DomainName** – [optional] The domain name in which to delete rows from the database table.	VARCHAR
OUT	**Status** – SUCCESS, NODELETE or FAIL [if FAIL then review message output]	VARCHAR
OUT	**datasourcePath** – The datasource path tables that were updated.	VARCHAR
OUT	**rowsDeleted** – Number of rows deleted into the privilege database.	INTEGER
OUT	**message** – a general message	LONGVARCHAR
OUT	**sqlStatement** – The SQL Statement issued to delete rows.	LONGVARCHAR

Database Maintenance: Load Database Users

16. **loadUsers_EXCEL –** This procedure is the generic interface for inserting and updating users from the generic Resource_Privileges_LOAD_DB.xlsx spreadsheet. The location of the resource in DV is as follows:
/shared/ASAssets/BestPractices_v81/PrivilegeScripts/Metadata/Privileges_DS_EXCEL/Resource_Privileges_LOAD_DB.xlsx.

A delete may be performed from this procedure but it must follow these rules:

1. Perform delete as per filters [Organization, Project, SubProject] from rows in that exist in the EXCEL spreadsheet.

2. This will not delete rows that are not specified in the spreadsheet.

Alternatively, use a broader delete capability: deleteUsers_DB()

Location:
/shared/ASAssets/BestPractices_v81/PrivilegeScripts/ModifyDBPrivileges/loadUsers_EXCEL

Direction	Parameter Name	Parameter Type
IN	**debug** – Y=debug on. N=debug off.	VARCHAR
IN	**datasource** – REQUIRED FILTER: DB_[LLE,PROD], The target database of the users. • DB_LLE – SQL Server database for lower level environments. Basically, it is used for testing purposes and developing new functionality. • DB_PROD – SQL Server production database. This connection should always be used unless developing new functionality. • To override the default, provide explicit filter type: • Oracle:　DB_LLE_ORA or DB_PROD_ORA • Sql Server: DB_LLE_SS or DB_PROD_SS	VARCHAR
IN	**Organization** – [optional] Provides a filter to only load rows in the spreadsheet for this organization name.	VARCHAR

OUT	**maintenanceMessage** – message from the performSupportingTableMaintenance() procedure if applicable.	LONGVARCHAR
OUT	**maintenanceProjectPairs** – The number of Organization/Project combination pairs updated during performSupportingTableMaintenance().	INTEGER
OUT	**message** – a general message	LONGVARCHAR

Database Maintenance: Delete Database Users

17. **deleteUsers_DB –** This procedure is the delete users in the database table PRIV_USERS that is associated with the input variable "datasource".

Location: /shared/ASAssets/BestPractices_v81/PrivilegeScripts/ModifyDBPrivileges/deleteUsers_DB

Direction	Parameter Name	Parameter Type
IN	**debug** – Y=debug on. N=debug off.	VARCHAR
IN	**datasource** – REQUIRED FILTER: DB_[LLE,PROD], The target database of the privileges. • DB_LLE – SQL Server database for lower level environments. Basically, it is used for testing purposes	VARCHAR

Direction	Parameter Name	Parameter Type
	and developing new functionality. • DB_PROD – SQL Server production database. This connection should always be used unless developing new functionality. • To override the default, provide explicit filter type: • Oracle: DB_LLE_ORA or DB_PROD_ORA • Sql Server: DB_LLE_SS or DB_PROD_SS	
IN	**performDelete** – Y or N. Y=perform delete as per input filters [Organization, Project, SubProject] from rows in the database table. N=do not perform the delete of rows..	CHAR(1)
IN	**Organization** – [recommended] Provides a filter to delete rows from the database table for this organization name. Wild card character=%	VARCHAR
IN	**Project** – [recommended] Provides a filter to delete rows from the database table for this project name. Wild card character=%	VARCHAR
IN	**SubProject** – [optional] Provides a filter to delete rows from the database table for this subproject name. Wild card character=%	VARCHAR
IN	**EnvironmentName** – [optional] The TDV server environment [DEV, TEST, UAT, PROD] in which to delete rows from the database table. No wild card allowed.	VARCHAR
IN	**UserName** – [optional] The user name for which to delete rows from the database table.	VARCHAR
IN	**DomainName** – [optional] The domain name in which to delete rows from the database table.	VARCHAR
OUT	**Status** – SUCCESS, NODELETE or FAIL [if FAIL then review message output]	VARCHAR
OUT	**datasourcePath** – The datasource path tables that were updated.	VARCHAR
OUT	**rowsDeleted** – Number of rows deleted into the privilege database.	INTEGER
OUT	**message** – a general message	LONGVARCHAR
OUT	**sqlStatement** – The SQL Statement issued to delete rows.	LONGVARCHAR

Database Maintenance: [INTERNAL ONLY] Perform Supporting Table Maintenance

18. **performSupportingTableMaintenance –** This procedure is used to perform table maintenance on the supporting tables in the database for the entire spreadsheet. It will automatically determine the correct combinations of Organizations and Projects and

insert/update accordingly by grouping them together and invoking performSupportingTableMaintenanceSingle() for each pair. This procedure should be invoked once prior invoking: loadGroups_EXCEL, loadPrivileges_EXCEL, and loadUsers_EXCEL

Location:
/shared/ASAssets/BestPractices_v81/PrivilegeScripts/ModifyDBPrivileges/TableMaintenance/performSupportingTableMaintenance

Direction	Parameter Name	Parameter Type
IN	**debug** – Y=debug on. N=debug off.	CHAR(1)
IN	**datasource** – REQUIRED FILTER: DB_[LLE,PROD], The target database of the users. • DB_LLE – SQL Server database for lower level environments. Basically, it is used for testing purposes and developing new functionality. • DB_PROD – SQL Server production database. This connection should always be used unless developing new functionality. • To override the default, provide explicit filter type: • Oracle: DB_LLE_ORA or DB_PROD_ORA • Sql Server: DB_LLE_SS or DB_PROD_SS	VARCHAR(255)
IN	**performInsert** – Y or N. Y=yes perform insert or update. N=no do not perform insert.	CHAR(1)
OUT	**Status** – SUCCESS or an exception is thrown.	VARCHAR
OUT	**numOrgProjectPairs** – The number of Organization/Project combination pairs updated.	INTEGER
OUT	**message** – a general message	LONGVARCHAR

19. **performSupportingTableMaintenanceSingle –** This procedure is invoked by each of the load procedures automatically to determine if the supporting tables require maintenance. This procedure is used to perform table maintenance on the supporting tables in the database for a single Organization and Project combination.

Location:
/shared/ASAssets/BestPractices_v81/PrivilegeScripts/ModifyDBPrivileges/TableMaintenance/performSupportingTableMaintenanceSingle

Table Name	Require Fields
PRIV_ORGANIZATION_TYPE:	ORGANIZATION_NAME
PRIV_PROJECT_TYPE:	ORGANIZATION_NAME
	PROJECT_NAME

PRIV_SUBPROJECT_TYPE:	SUBPROJECT_NAME
	PROJECT_NAME
	ORGANIZATION_NAME
PRIV_DOMAIN_TYPE:	DOMAIN_NAME
PRIV_ENVIRONMENT_TYPE:	ENVIRONMENT_NAME

Rules:

1. performInsert:

When performInsert=Y, perform the insert of the new row for the given table.

When performInsert=N, do not perform the insert of the new row for the given table but display what will happen.

2. organization

Used for tables ORGANIZATION_TYPE or PROJECT_TYPE

If not null, then test ORGANIZATION_TYPE.ORGANIZATION_NAME for existence.

If not exist then insert.

3. projectName

Used for table PRIV_PROJECT_TYPE.ORGANIZATION_NAME and PROJECT_NAME

If projectName and organization is not null then test PRIV_PROJECT_TYPE.ORGANIZATION_NAME and PROJECT_NAME for existence.

If not exist then insert.

4. subprojectList

Used for table PRIV_SUBPROJECT_TYPE.SUBPROJECT_NAME and PROJECT_NAME and ORGANIZATION_NAME

This may be a comma separated list of subprojects.

For each subproject and project, if they are not null then test PRIV_PROJECT_TYPE.SUBPROJECT_NAME and PROJECT_NAME and ORGANIZATION_NAME for existence.

If not exist then insert.

5. domainNameList

Used for tables PRIV_DOMAIN_TYPE

This may be a comma separated list of domain names.

If not null, then test PRIV_DOMAIN_TYPE.DOMAIN_NAME for existence.

If not exist then insert.

6. environmentNameList

Used for tables PRIV_ENVIRONMENT_TYPE

This may be a comma separated list of environment names.

If not null, then test PRIV_ENVIRONMENT_TYPE.ENVIRONMENT_NAME for existence.

If not exist then insert.

Direction	Parameter Name	Parameter Type
IN	**debug** – Y=debug on. N=debug off.	CHAR(1)
IN	**performInsert** – Y or N. Y=yes perform insert or update. N=no do not perform insert or update but display the same messages to see what will be executed.	CHAR(1)
IN	**organization** – leave null unless you want to insert into ORGANIZATION_TYPE and/or PROJECT_TYPE. Examples (1 of): ORG1, ORG2, ORG3.	VARCHAR
IN	**projectName** – leave null unless you want to insert into PROJECT_TYPE and/or SUBPROJECT_TYPE. Examples (1 of): PROJECT1, PROJECT2.	VARCHAR
IN	**subprojectList** – leave null unless you want to insert into SUBPROJECT_TYPE. This may be a comma separated list of subprojects. Examples (1 of): SB1, SB2, SB3.	LONGVARCHAR
IN	**domainName List**– leave null unless you want to insert into DOMAIN_TYPE. This may be a comma separated list of domain names. Examples (1 of): ldap, composite, dynamic	LONGVARCHAR
IN	**environemntNameList** – leave null unless you want to insert into ENVIRONMENT_TYPE. This may be a comma separated list of environment names. Examples (1 of): DEV, UAT, PROD	LONGVARCHAR
OUT	**message** – a general message	LONGVARCHAR

Database Maintenance: Fix Privilege Table

20. **fix_PROD_ORA_PRIV_PRIVILEGES –** This procedure is used to perform table maintenance on the PRIV_PRIVILEGES Oracle PROD table to fix any issues.

   20.1. **fix_PROD_SS_PRIV_PRIVILEGES –** This procedure is used to perform table maintenance on the PRIV_PRIVILEGES SQL Server PROD table to fix any issues.

   20.2. The following columns should not contain any blanks, spaces, empty character or any characters other than [X,Y,N]. This procedure updates the PRIV_PRIVILEGES table and sets the column to NULL if it does not X, Y and N. The column being updated include: INITIALIZE, READ_ACCESS, WRITE_ACCESS, EXECUTE_ACCESS, SELECT_ACCESS, UPDATE_ACCESS, INSERT_ACCESS, DELETE_ACCESS, GRANT_ACCESS.

Location:
/shared/ASAssets/BestPractices_v81/PrivilegeScripts/ModifyDBPrivileges/TableMaintenance/fix_...

Direction	Parameter Name	Parameter Type
IN	**inOrganization** – RECOMMENDED FILTER: The name of the organization such as ORG1 or ORG2.	VARCHAR(255)
IN	**inProject** – RECOMMENDED FILTER: The name of the project that is hosted on DV for this "Env Type". This provides a filter for only applying privileges for the given project. If left blank, all projects will be updated.	VARCHAR(255)
OUT	**countINITIALIZE** – number of rows modified.	INTEGER
OUT	**countREAD_ACCESS** – number of rows modified.	INTEGER
OUT	**countWRITE_ACCESS** – number of rows modified.	INTEGER
OUT	**countEXECUTE_ACCESS** – number of rows modified.	INTEGER
OUT	**countSELECT_ACCESS** – number of rows modified.	INTEGER
OUT	**countUPDATE_ACCESS** – number of rows modified.	INTEGER
OUT	**countINSERT_ACCESS** – number of rows modified.	INTEGER
OUT	**countDELETE_ACCESS** – number of rows modified.	INTEGER
OUT	**countGRANT_ACCESS** – number of rows modified.	INTEGER
OUT	**countOWNER_NAME_DEV** – number of rows modified.	INTEGER
OUT	**countOWNER_NAME_UAT** – number of rows modified.	INTEGER
OUT	**countOWNER_NAME_PROD** – number of rows modified.	INTEGER
OUT	**countOWNER_DOMAIN_DEV** – number of rows modified.	INTEGER
OUT	**countOWNER_DOMAIN_UAT** – number of rows modified.	INTEGER
OUT	**countOWNER_DOMAIN_PROD** – number of rows modified.	INTEGER

Database Maintenance: Modify Organization Type

21. **modify_01_PRIV_ORGANIZATION_TYPE –** This procedure is used to insert/update/delete/inactivate rows in the PRIV_ORGANIZATION_TYPE table.

    Location:
    /shared/ASAssets/BestPractices_v81/PrivilegeScripts/ModifyDBPrivileges/TableMaintenance/ modify_01_PRIV_ORGANIZATION_TYPE

    Examples:

    ORG1

    ORG2

Direction	Parameter Name	Parameter Type
IN	**debug** – Y=debug on. N=debug off.	CHAR(1)
IN	**datasource** – REQUIRED FILTER: DB_[LLE,PROD], The target database. - DB_LLE – SQL Server database for lower level environments. Basically, it is used for testing purposes and developing new functionality. - DB_PROD – SQL Server production database. This connection should always be used unless developing new functionality. - To override the default, provide explicit filter type: - Oracle: DB_LLE_ORA or DB_PROD_ORA - Sql Server: DB_LLE_SS or DB_PROD_SS	VARCHAR(255)
IN	**setInactive** – Set the ISACTIVE flag to N. Y=if the record exists set it inactive. Overrides performDelete. N/null=do not perform this operation.	VARCHAR(1)
IN	**performDelete** – Delete the row if it exists. Y=perform a delete using filters supplied. N/null=do not perform delete but perform insert or update instead.	VARCHAR(1)
IN	**inORGANIZATION_NAME** – The name of the organization such as ORG1 or ORG2.	VARCHAR(255)
OUT	**message** – A general message	LONGVARCHAR

Database Maintenance: Modify Domain Type

22. **modify_02_PRIV_DOMAIN_TYPE –** This procedure is used to insert/update/delete/inactivate rows in the PRIV_DOMAIN_TYPE table. The two composite domains are "composite" and "dynamic". Additional domain names for LDAP will be whatever the administrator chooses such as "ldap".

Location:
/shared/ASAssets/BestPractices_v81/PrivilegeScripts/ModifyDBPrivileges/TableMaintenance/
modify_02_PRIV_DOMAIN_TYPE

Examples:

ldap

composite

dynamic

Direction	Parameter Name	Parameter Type
IN	**debug** – Y=debug on. N=debug off.	CHAR(1)
IN	**datasource** – REQUIRED FILTER: DB_[LLE,PROD], The target database. • DB_LLE – SQL Server database for lower level environments. Basically, it is used for testing purposes and developing new functionality. • DB_PROD – SQL Server production database. This connection should always be used unless developing new functionality. • To override the default, provide explicit filter type: • Oracle: DB_LLE_ORA or DB_PROD_ORA • Sql Server: DB_LLE_SS or DB_PROD_SS	VARCHAR(255)
IN	**setInactive** – Set the ISACTIVE flag to N. Y=if the record exists set it inactive. Overrides performDelete. N/null=do not perform this operation.	VARCHAR(1)
IN	**performDelete** – Delete the row if it exists. Y=perform a delete using filters supplied. N/null=do not perform delete but perform insert or update instead.	VARCHAR(1)
IN	**inDOMAIN_NAME** – The domain name to insert/update/delete/inactivate. If both setInactive and performDelete are null or N then perform the insert. If the row does not exist then insert. If the row already exists then do nothing.	VARCHAR(255)
OUT	**message** – A general message	LONGVARCHAR

Database Maintenance: Modify Environment Type

23. **modify_03_PRIV_ENVIRONMENT_TYPE –** This procedure is used to insert/update/delete/inactivate rows in the PRIV_ENVIRONMENT_TYPE table. The environment will match the LDAP server environment. In some organizations, they will have an environment for each deployment area such as DEV, UAT and PROD. Other organizations may only have a single LDAP environment such as PROD in which all DV

instances are connected to. The name is an abstract name but descriptive of the LDAP instance that the DV domain is connecting to.

Location:
/shared/ASAssets/BestPractices_v81/PrivilegeScripts/ModifyDBPrivileges/TableMaintenance/ modify_03_PRIV_ENVIRONMENT_TYPE

Examples:

DEV

UAT

PROD

Direction	Parameter Name	Parameter Type
IN	**debug** – Y=debug on. N=debug off.	CHAR(1)
IN	**datasource** – REQUIRED FILTER: DB_[LLE,PROD], The target database. • DB_LLE – SQL Server database for lower level environments. Basically, it is used for testing purposes and developing new functionality. • DB_PROD – SQL Server production database. This connection should always be used unless developing new functionality. • To override the default, provide explicit filter type: • Oracle: DB_LLE_ORA or DB_PROD_ORA • Sql Server: DB_LLE_SS or DB_PROD_SS	VARCHAR(255)
IN	**setInactive** – Set the ISACTIVE flag to N. Y=if the record exists set it inactive. Overrides performDelete. N/null=do not perform this operation.	VARCHAR(1)
IN	**performDelete** – Delete the row if it exists. Y=perform a delete using filters supplied. N/null=do not perform delete but perform insert or update instead.	VARCHAR(1)
IN	**inENVIRONMENT_NAME** – The environment name to insert/update/delete/inactivate. If both setInactive and performDelete are null or N then perform the insert. If the row does not exist then insert. If the row already exists then do nothing.	VARCHAR(255)
OUT	**message** – A general message	LONGVARCHAR

Database Maintenance: Modify Project Type

24. **modify_04_PRIV_PROJECT_TYPE –** This procedure is used to insert/update/delete/inactivate rows in the PRIV_PROJECT_TYPE table. This procedure performs a cascade modify for the PRIV_ORGANIZATION_TYPE table also. However, it does not perform the cascade inactivate. That must be done explicitly on each table.

Location:
/shared/ASAssets/BestPractices_v81/PrivilegeScripts/ModifyDBPrivileges/TableMaintenance/
modify_04_PRIV_PROJECT_TYPE

Examples:

PROJECT_NAME	ORGANIZATION_NAME
PROJECT1	ORG1
PROJECT2	ORG2

Direction	Parameter Name	Parameter Type
IN	**debug** – Y=debug on. N=debug off.	CHAR(1)
IN	**datasource** – REQUIRED FILTER: DB_[LLE,PROD], The target database. • DB_LLE – SQL Server database for lower level environments. Basically, it is used for testing purposes and developing new functionality. • DB_PROD – SQL Server production database. This connection should always be used unless developing new functionality. • To override the default, provide explicit filter type: • Oracle: DB_LLE_ORA or DB_PROD_ORA • Sql Server: DB_LLE_SS or DB_PROD_SS	VARCHAR(255)
IN	**setInactive** – Set the ISACTIVE flag to N. Y=if the record exists set it inactive. Overrides performDelete. N/null=do not perform this operation.	VARCHAR(1)
IN	**performDelete** – Delete the row if it exists. Y=perform a delete using filters supplied. N/null=do not perform delete but perform insert or update instead.	VARCHAR(1)
IN	**inPROJECT** – The Composite server environment in which to update studio rights for: [DEV, UAT, PROD].	VARCHAR(255)
IN	**inORGANIZATION_NAME** – The name of the organization such as ORG1 or ORG2.	VARCHAR(255)
OUT	**message** – A general message	LONGVARCHAR

Database Maintenance: Modify SubProject Type

25. **modify_05_PRIV_SUBPROJECT_TYPE –** This procedure is used to insert/update/delete/inactivate rows in the PRIV_SUBPROJECT_TYPE table. This procedure performs a cascade modify for the PRIV_PROJECT_TYPE table also. This procedure performs a cascade modify for the PRIV_ORGANIZATION_TYPE table also. However, it does not perform the cascade inactivate. That must be done explicitly on each table.

Location:
/shared/ASAssets/BestPractices_v81/PrivilegeScripts/ModifyDBPrivileges/TableMaintenance/
modify_05_PRIV_SUBPROJECT_TYPE

Examples:

SUBPROJECT_NAME	PROJECT_NAME
SB1	PROJECT1
SB2	PROJECT2

Direction	Parameter Name	Parameter Type
IN	**debug** – Y=debug on. N=debug off.	CHAR(1)
IN	**datasource** – REQUIRED FILTER: DB_[LLE,PROD], The target database. • DB_LLE – SQL Server database for lower level environments. Basically, it is used for testing purposes and developing new functionality. • DB_PROD – SQL Server production database. This connection should always be used unless developing new functionality. • To override the default, provide explicit filter type: • Oracle: DB_LLE_ORA or DB_PROD_ORA • Sql Server: DB_LLE_SS or DB_PROD_SS	VARCHAR(255)
IN	**setInactive** – Set the ISACTIVE flag to N. Y=if the record exists set it inactive. Overrides performDelete. N/null=do not perform this operation.	VARCHAR(1)
IN	**performDelete** – Delete the row if it exists. Y=perform a delete using filters supplied. N/null=do not perform delete but perform insert or update instead.	VARCHAR(1)
IN	**inSUBPROJECT_NAME** – The subproject name to insert/update/delete/inactivate. If both setInactive and performDelete are null or N then perform the insert. If the row does not exist then insert. If the row already exists then do nothing.	VARCHAR(255)
IN	**inPROJECT** – The Composite server environment in which to update studio rights for: [DEV, UAT, PROD].	VARCHAR(255)
IN	**inORGANIZATION_NAME** – The name of the organization such as ORG1 or ORG2.	VARCHAR(255)
OUT	**message** – A general message	LONGVARCHAR

Database Maintenance: Modify Privileges

26. **modify_06_PRIV_PRIVILEGES –** This procedure is used to insert/update/delete/inactivate rows in the PRIV_PRIVILEGES table. These are rows that come from the Privileges_shared, Privileges_databases, and Privileges_webservices sheets in the Resource_Privileges_LOAD_DB.xlsx spreadsheet.

For deleting records the following fields are used to create the where clause: PRIVIELGE_ID - if present then it only uses this to delete that 1 record.

The following list of fields are used for constructing a dynamic where clause. If a field contains a null then it is not used for the where clause. Therefore, it provides a lot of flexibility for deleting as much or little as you wish. inENVIRONMENT_NAME, inORGANIZATION_NAME, inPROJECT_NAME, inSUBPROJECT_NAME, inRESOURCE_PATH, inNAME, inNAME_TYPE, inDOMAIN_NAME

Location:
/shared/ASAssets/BestPractices_v81/PrivilegeScripts/ModifyDBPrivileges/TableMaintenance/ modify_06_PRIV_PRIVILEGES

Example:

PRIVILEGE_ID:	2
ORGANIZATION_NAME:	ORG1
PRIVILEGE_TYPE:	SHARED
PROJECT_NAME:	Common
SUBPROJECT_NAME:	[NULL]
RESOURCE_PATH:	/shared/examples
RESOURCE_TYPE:	CONTAINER

UPDATEDDATE: 2017-05-17 15:31:13
ISACTIVE: Y

Direction	Parameter Name	Parameter Type
IN	**debug** – Y=debug on. N=debug off.	CHAR(1)
IN	**datasource** – REQUIRED FILTER: DB_[LLE,PROD], The target database of the privileges. • DB_LLE – SQL Server database for lower level environments. Basically, it is used for testing purposes and developing new functionality. • DB_PROD – SQL Server production database. This connection should always be used unless developing new functionality. • To override the default, provide explicit filter type: • Oracle: DB_LLE_ORA or DB_PROD_ORA • Sql Server: DB_LLE_SS or DB_PROD_SS	VARCHAR(255)
IN	**performInsertUpdate** – Y or N. Y=yes perform insert or update. N=no do not perform insert or update but display the same messages to see what will be executed.	VARCHAR(1)
IN	**setInactive** – Set the ISACTIVE flag to N. Y=if the record exists set it inactive. Overrides performDelete. N/null=do not perform this operation.	VARCHAR(1)
IN	**performDelete** – Delete the row if it exists. Y=perform a delete using filters supplied. N/null=do not perform delete but perform insert or update instead.	VARCHAR(1)
IN	**inPRIVILEGE_ID** – This is used only when setting a row inactive or deleting a specific row by its generated PRIVILEGE_ID.	DECIMAL(38,0)
IN	**inORGANIZATION_NAME** – The name of the organization such as ORG1 or ORG2.	VARCHAR(255)
IN	**inPROJECT_NAME** – The project name to	VARCHAR(255)

Direction	Parameter Name	Parameter Type
	insert/update/delete/inactivate. If both setInactive and performDelete are null or N then perform the insert. If the row does not exist then insert. If the row already exists then do nothing.	
IN	**inSUBPROJECT_NAME** – The subproject name to insert/update/delete/inactivate.	VARCHAR(255)
IN	**inRESOURCE_PATH** – The DV resource path.	VARCHAR(4000)
IN	**inRESOURCE_TYPE** – The DV resource type such as DATA_SOURCE, CONTAINER, TABLE, COLUMN or etc.	VARCHAR(255)
IN	**inRECURSE_**DEPENDENCIES – N or blank = Do not recurse. Y = Apply recursively to depenendencies	VARCHAR(1)
IN	**inRECURSE_DEPENDENTS** – N or blank = Do not recurse. Y = Apply recursively to depenents	VARCHAR(1)
IN	**inRECURSE_CHILD** – N or blank = do not recurse. Set specified privileges for the resource only. YM = Only apply modification recursively YC = Make child resources look like this resource recursively Concept 1: Only select YM to recurse child resources when the resource being set is at the lowest level at which it is safe to recursively set privileges for a given USER or GROUP. If the resource is an intermediate level folder with other branches offshoot from it then only apply the privilege modification to the resource folder using "N" unless all branches are required to have the same privilege settings. "YC" should only be used when you want to reset all privileges for other USERS or GROUPS to "NONE" except for the current USER or GROUP being set. Concept 2: If the higher level resource folder is set with "YC" then it is not necessary to set this USER or GROUP for branch-level resources.	VARCHAR(2)
IN	**inREVOKE_ALL** – Revoke all privileges for all users and all groups prior to setting the specified privileges. N or blank=Do not revoke all privileges Y=Revoke all privileges This only needs to be done once per Resource Path group. If it user chooses to revoke all, then it must only be done on the first entry for a given Resource Path as it will set the privileges to "NONE" for all users and groups. If this value is set to Y on subsequent calls, it will reset any privileges previously set.	VARCHAR(1)
IN	**inNAME** – The user or group name.	VARCHAR(255)
IN	**inNAME_TYPE** – This is either USER or GROUP depending on the NAME field.	VARCHAR(255)

Direction	Parameter Name	Parameter Type
IN	**inDOMAIN_NAME** – The domain the group exists in.	VARCHAR(255)
IN	**inENVIRONMENT_NAME** – The Composite server environment in which to update studio rights for: [DEV, UAT, PROD].	VARCHAR(255)
IN	**inREAD_ACCESS** – null or X to indicate access.	VARCHAR(1)
IN	**inWRITE_ACCESS** – null or X to indicate access.	VARCHAR(1)
IN	**inEXECUTE_ACCESS** – null or X to indicate access.	VARCHAR(1)
IN	**inSELECT_ACCESS** – null or X to indicate access.	VARCHAR(1)
IN	**inUPDATE_ACCESS** – null or X to indicate access.	VARCHAR(1)
IN	**inINSERT_ACCESS** – null or X to indicate access.	VARCHAR(1)
IN	**inDELETE_ACCESS** – null or X to indicate access.	VARCHAR(1)
IN	**inGRANT_ACCESS** – null or X to indicate access.	VARCHAR(1)
IN	**inINITIALIZE** – null or X to indicate access. This field should be ignored.	VARCHAR(1)
IN	**inOWNER_NAME** – The owner of the resource which gets set at the time the privilege is applied. For ENVIRONMENT_NAME=DEV, the owner should be null so that it does not get set. For other environments, it may be any valid user for that environment such as "admin".	VARCHAR(255)
IN	**inOWNER_DOMAIN** – The owner domain of the resource which gets set at the time the privilege is applied. For ENVIRONMENT_NAME=DEV, the owner domain should be null so that it does not get set. For other environments, it may be any valid domain in which OWNER_NAME is contained for that environment such as "composite".	VARCHAR(255)
IN	**inCOMMENTS** – a general comment.	VARCHAR(1024)
OUT	**actionType** – I=insert, U=update, D=delete, S=set inactive	CHAR(1)
OUT	**rowsProcessed** – Number of rows process for the action type	INTEGER
OUT	**duplicateRows** – Number of duplicate rows found	INTEGER
OUT	**duplicateRowMsg** – message for duplicate rows	LONGVARCHAR
OUT	**message** – a general message	LONGVARCHAR

Database Maintenance: Modify Groups

27. **modify_07_PRIV_GOUPS –** This procedure is used to insert/update/delete/inactivate rows in the PRIV_GROUPS table. These are rows that come from the Group_List sheet in the Resource_Privileges_LOAD_DB.xlsx spreadsheet.

Location:
